

## REZA AZARI, D.D.S.

### DISCLOSURE—BISPHOSPHONATE THERAPY

Bisphosphonates are a type of drug given to millions of Americans to treat osteoporosis or as part of cancer treatment, namely for breast cancer, lung cancer, prostate cancer, multiple myeloma, Paget's disease of the bone, alveolar necrosis of the bone or post-menopausal osteoporosis. They are sometime given orally and other times are given through people's veins. Some of the common names include but are not limited to:

- Actonel (risedronate)
- Aredia (pamidronate)
- Skelid (tiludronate)
- Bonefos (clodronate)
- Didronel (etidronate)
- Zometa (zoledronic acid)
- Fosamaz (alendronate)
- Boniva (ibandronate)
- Pamidronate
- Fosamax Plus D (Alendronate)
- Ostac
